

PYTHON

INTERVIEW QUESTIONS

by Pycode.Hubb

Q.1 What is Python?

- ➔ Python is a high-level, interpreted programming language known for its simple and readable syntax.
-

Q2. Why is Python popular?

- ➔ Python is popular because it is easy to learn, versatile, and widely used in many fields.
-

Q3. What are the key features of Python?

- ➔ Python is simple, platform-independent, object-oriented, and has a large collection of libraries.
-

Q4. Is Python compiled or interpreted?

- ➔ Python is an interpreted language that executes code line by line.
-

Q5. What are variables in Python?

- ➔ Variables are used to store and manage data in a program.
-

Q6. What are data types in Python?

- ➔ Data types define the kind of value a variable can store.
-

Q7. What is an integer (int)?

→ An integer is a whole number without a decimal point.

Q8. What is a float?

→ A float is a number that contains a decimal point.

Q9. What is a string?

→ A string is a sequence of characters enclosed in quotes.

Q10. What is a boolean?

→ A boolean represents either True or False.

Q11. What is a list?

→ A list is an ordered and mutable collection of items.

Q12. What is a tuple?

→ A tuple is an ordered and immutable collection of items.

Q13. What is a set?

→ A set is an unordered collection of unique values.

Q14. What is a dictionary?

➔ A dictionary stores data as key-value pairs.

Q15. What is None in Python?

➔ None represents the absence of a value.

Q16. What is type casting?

➔ Type casting is the process of converting one data type into another.

Q17. What is the difference between List and Tuple?

➔ Lists can be modified, while tuples cannot be changed after creation.

Q18. What is the difference between List and Set?

➔ Lists allow duplicate values, while sets store only unique values.

Q19. What is the type() function?

➔ The type() function is used to find the data type of a value or variable.

Q20. What are Python keywords?

- ➔ Keywords are reserved words that have special meanings in Python.
-

Q21. What is an operator?

- ➔ An operator is a symbol used to perform operations on values and variables.
-

Q22. What is an if statement?

- ➔ An if statement is used to execute code only when a condition is true.
-

Q23. What is an if-else statement?

- ➔ An if-else statement executes one block of code if a condition is true and another if it is false.
-

Q24. What is an elif statement?

- ➔ An elif statement is used to check multiple conditions after an if statement.
-

Q25. What is a for loop?

- ➔ A for loop is used to iterate over a sequence of items.
-

Q26. What is a while loop?

- ➔ A while loop repeatedly executes code as long as a condition remains true.
-

Q27. What is the break statement?

- ➔ The break statement immediately exits a loop.
-

Q28. What is the continue statement?

- ➔ The continue statement skips the current iteration and moves to the next one.
-

Q29. What is a function?

- ➔ A function is a reusable block of code that performs a specific task.
-

Q30. Why are functions used?

- ➔ Functions help organize code, reduce repetition, and improve readability.
-

Q31. What are function arguments?

- ➔ Function arguments are values passed to a function when it is called.
-

Q32. What is a return statement?

➔ A return statement sends a value back from a function.

Q33. What is a lambda function?

➔ A lambda function is a small anonymous function written in a single line.

Q34. What is recursion?

➔ Recursion is a technique where a function calls itself.

Q35. What is a module?

➔ A module is a Python file that contains reusable code.

Q36. What is a package?

➔ A package is a collection of related Python modules.

Q37. What is PIP?

➔ PIP is Python's package manager used to install and manage libraries.

Q38. What is an exception?

➔ An exception is an error that occurs during program execution.

Q39. What is exception handling?

➔ Exception handling is the process of managing errors without stopping the program.

Q40. What is a class?

➔ A class is a blueprint used to create objects.

Q41. What is an object?

➔ An object is an instance of a class.

Q42. What is a constructor?

➔ A constructor is a special method that runs automatically when an object is created.

Q43. What is inheritance?

➔ Inheritance allows one class to acquire properties and methods from another class.

Q44. What is polymorphism?

➔ Polymorphism allows the same method name to perform different actions.

Q45. What is encapsulation?

- ➔ Encapsulation is the process of bundling data and methods into a single unit.
-

Q46. What is abstraction?

- ➔ Abstraction hides implementation details and shows only essential features.
-

Q47. What is a decorator?

- ➔ A decorator is a function used to modify the behavior of another function.
-

Q48. What is a generator?

- ➔ A generator is a function that produces values one at a time instead of all at once.
-

Q49. What is a virtual environment?

- ➔ A virtual environment is an isolated workspace used to manage project dependencies.
-

Q50. Why should you learn Python?

- ➔ Python is beginner-friendly and widely used in web development, automation, data science, AI, and many other fields.
-

GRAB OUR ULTIMATE PYTHON BUNDLE!

Master Python from basic to advanced with detailed explanations and practical experience.
